SafeNight

Go out together. Get home together.

Consent-based safety for a night out, built on SpacetimeDB and NVIDIA Nemotron

A night out separates people fast

Groups split up

Different bars, dead phones, a text nobody sees for an hour.

"Sent" is not "seen"

A message in a group chat is not help. Nobody knows who is on it.

Tracking apps are all or nothing

Permanent location sharing feels like surveillance, so friends turn it off.

The scenario

Alex, Sam, Maya and Jordan are out together. Sam is the designated driver.

Late in the night Maya is alone and uneasy. She needs someone to come to her, now, without broadcasting her location to the world.

One tap gets a real person moving

1 · Ask

Maya taps Need help → Come to me.

2 · Alert

Her group is alerted. Nemotron plans who to reach first.

3 · Navigate

Jordan taps Accept & navigate. A live map shows both of them, plus walking directions.

4 · Arrived

Precise sharing ends when Jordan arrives. A human closes the loop.

Consent first: every share has a person, a scope and an expiry. The agent proposes, people decide.

What is in the app

Night Out groups

Start a hangout in one tap, join by code, designated driver with explicit acceptance.

Consent per person

Approximate or precise location, check-ins, messaging. Each grant has an expiry and a revoke.

Live finder map

Real GPS for everyone in the group; Come to me shows both people and opens walking directions.

Nemotron agent

Plans who to contact, waits for replies, escalates. Every step is a receipt: sent, delivered, acknowledged.

Deterministic safety rules

"May have been drinking" triggers a do-not-drive warning instantly, no AI in the path.

Ride and home

Ride deep links, pickup confirmation, "I'm home" closes the incident. Only a human can resolve.

How it is built

SpacetimeDB is the backend

- One TypeScript module on Maincloud: 40+ tables, 50+ reducers
- Per-user views and row-level security: you only ever receive what was consented to you
- Scheduled reducers for timers and sweeps; event tables push alerts in milliseconds
- Live position stream: one row per person, updated in place, pushed to the partner

Nemotron plans, policy decides

- nvidia/nemotron-3.5-super runs inside a scheduled procedure
- Multi-round tool loop with an allowlist and validator
- Never contacts the person in trouble; never resolves an incident
- Simulated fallback when the model is unavailable, always labeled

Phones, no install

- React PWA on Vercel; add to home screen
- Real-time subscriptions over WebSocket
- Leaflet map, Geolocation and motion sensors
- Walking directions hand off to Apple or Google Maps

Get home together

safenight-liart.vercel.app · github.com/sabharwalainesh/SafeNight

Messaging and calls are simulated in the demo. Location is real.
